

EXPERIMENT 33

Database as a Service (DaaS) — Azure SQL Database

AIM

To create a managed SQL database on Microsoft Azure and execute a basic SQL query to demonstrate Database as a Service (DaaS).

PROCEDURE

1. Sign in to Azure Portal and open Azure SQL.
2. Select SQL databases and choose Create.
3. Create/select a resource group and enter the database name.
4. Create a logical SQL server with administrator credentials.
5. Choose an appropriate compute and storage configuration.
6. Deploy the database and open its Overview page.
7. Open Query Editor, enter a basic SELECT query, execute it, and verify the result.

IMPLEMENTATION

An Azure SQL Database named DaaSLabDB is configured as a managed database service. The Query Editor is used to execute a basic SELECT statement:

SELECT * FROM Students;

Azure SQL Database supplies the managed database engine and infrastructure required by the application.

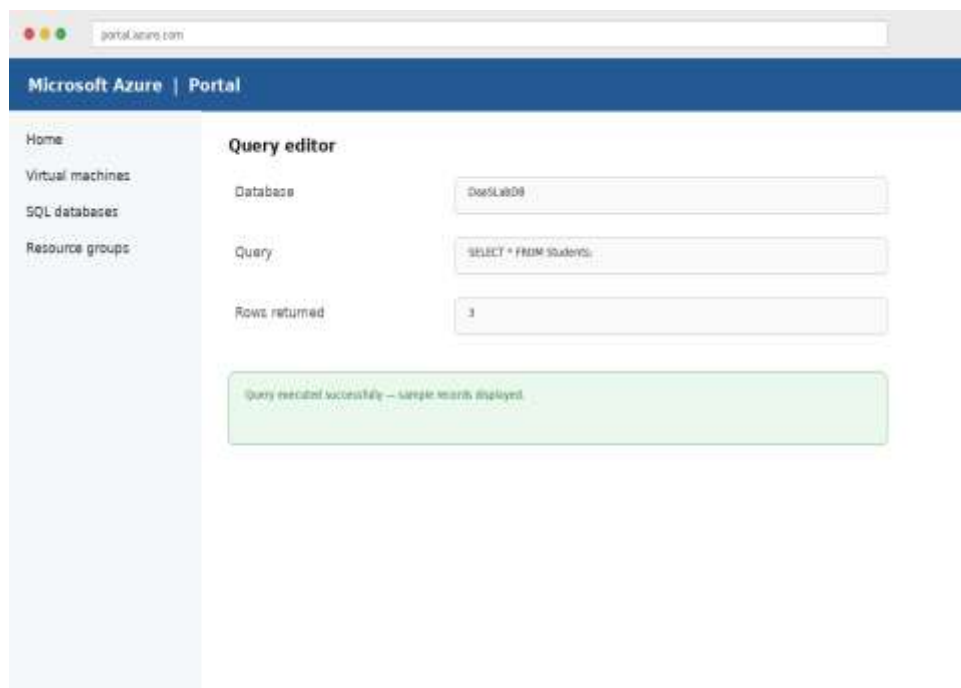

Figure 2: Illustrative Azure Portal implementation view.

RESULT

Database as a Service was demonstrated by provisioning Azure SQL Database and executing a basic SQL query.
