

Install Virtualbox/VMware Workstation with different flavours of linux or windows

OS on top of your present windows environment.

AIM:

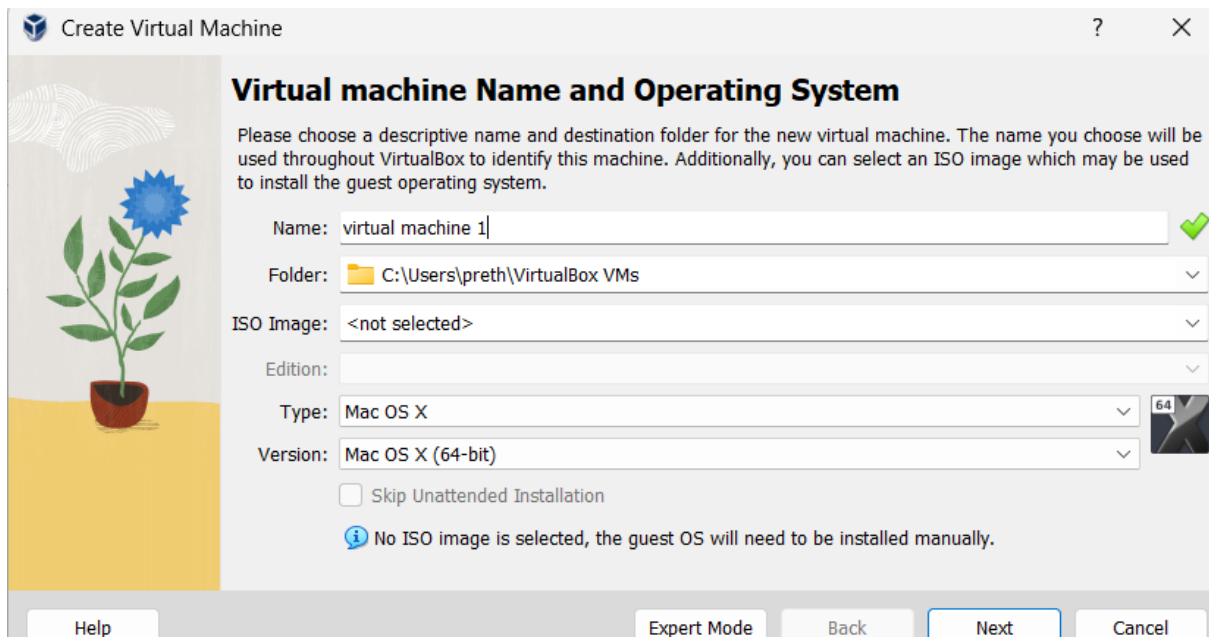

Aim

To install Oracle VirtualBox on a Windows host system and create and run a virtual machine with a Linux/Windows operating system to demonstrate virtualization.

Procedure :

1. **Download and install Oracle VirtualBox** on the existing Windows host system. VirtualBox allows multiple operating systems to run on a single physical computer.
2. **Download the ISO image** of the required guest operating system, such as Ubuntu Linux or Windows.
3. **Open Oracle VirtualBox** and click **New** to create a new virtual machine.
4. **Enter the VM name** and select the appropriate **Operating System Type and Version**. Select the downloaded ISO image as the installation media.
5. **Allocate system resources** such as RAM and processor cores according to the requirements of the guest OS, ensuring sufficient resources remain for the Windows host.
6. **Create a virtual hard disk**, select the required disk type and storage size, and complete the VM creation.
7. **Start the virtual machine** and follow the guest operating system's installation procedure. After installation, restart the VM and log in to the guest OS.
8. **Verify the virtualization** by running basic applications or commands inside the guest OS while the original Windows system continues to operate as the host OS.

STEP 1:

Create Virtual Machine

Virtual machine Name and Operating System

Please choose a descriptive name and destination folder for the new virtual machine. The name you choose will be used throughout VirtualBox to identify this machine. Additionally, you can select an ISO image which may be used to install the guest operating system.

Name: ✓

Folder:

ISO Image:

Edition:

Type: 64

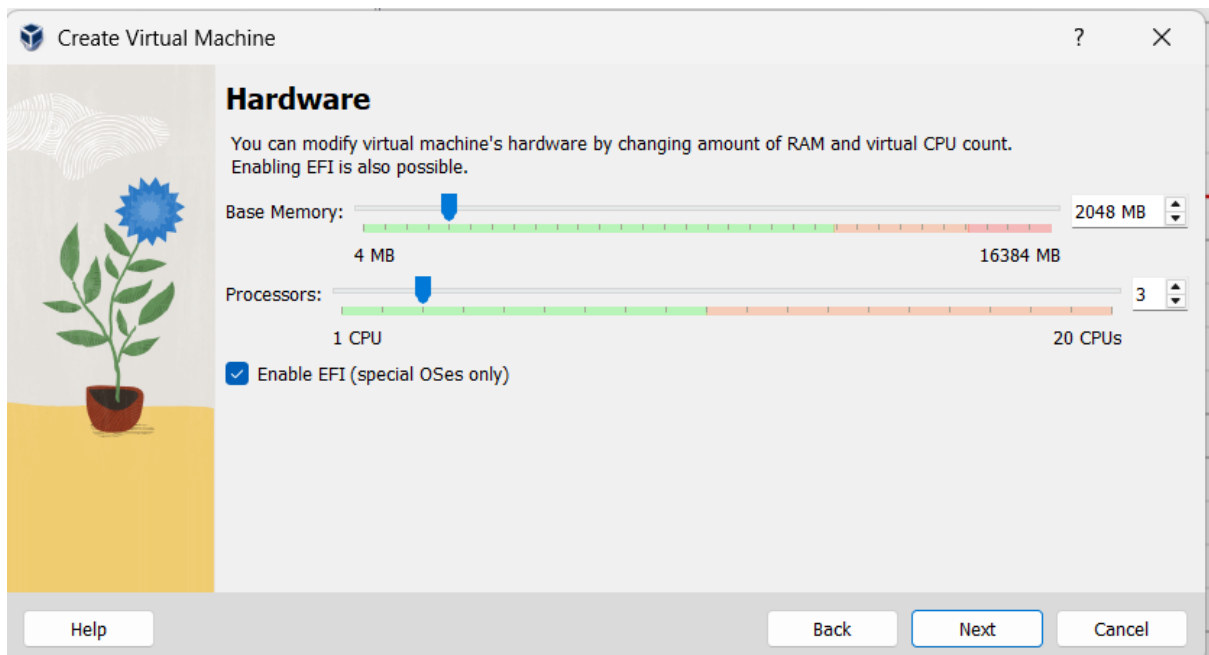

Version:

☐ Skip Unattended Installation

No ISO image is selected, the guest OS will need to be installed manually.

STEP 2:

Create Virtual Machine

Hardware

You can modify virtual machine's hardware by changing amount of RAM and virtual CPU count. Enabling EFI is also possible.

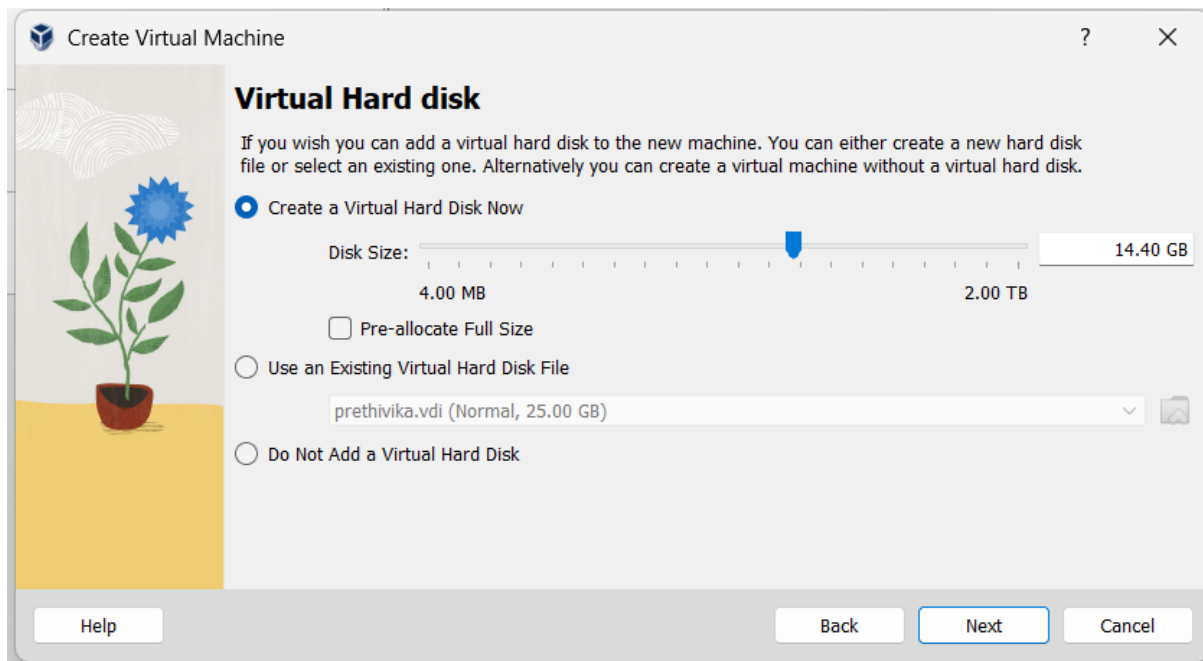

Base Memory: 4 MB 16384 MB

Processors: 1 CPU 20 CPUs

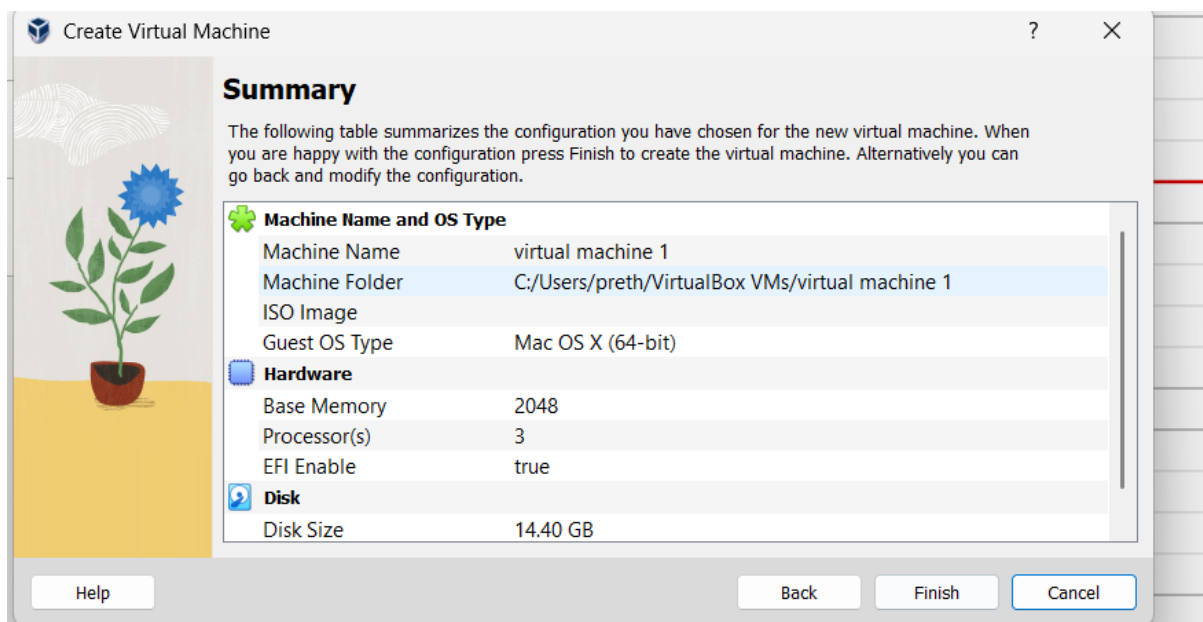

☒ Enable EFI (special OSes only)

STEP 4:

STEP 5:OUTPUT

Result

Thus, Oracle VirtualBox was successfully installed on the Windows host system and a guest operating system was successfully created and run in a virtual machine, demonstrating virtualization.
