

EXPERIMENT :20

Install Virtualbox with different flavours of linux or windows OS on top of windows

10 using custom installation.

AIM

To install and configure a Linux operating system on a Windows 10 host using **Oracle VirtualBox** with custom virtual machine settings such as memory, processor, storage, and ISO configuration.

PROCEDURE

1. Open **Oracle VirtualBox** in Windows 10 and click **New** to create a new virtual machine.
2. Enter the VM name as **Ubuntu**, select **Linux** as the type and **Ubuntu (64-bit)** as the version, and choose the option to **Skip Unattended Installation**.
3. Allocate the required **RAM and CPU**, such as 2048 MB RAM and 2 processors, according to the available system resources.
4. Create a new **VDI virtual hard disk** with dynamically allocated storage and assign approximately 25 GB of disk space.
5. Open **Settings** → **Storage**, attach the downloaded **Ubuntu ISO** file to the virtual optical drive, and save the configuration.
6. Start the virtual machine and perform the Ubuntu installation using the newly created virtual disk, then create the required user account and password.
7. Restart the VM after installation and verify that **Ubuntu Linux** successfully boots and operates independently within Oracle VirtualBox on the Windows 10 host.

IMPLEMENTATION:

RESULT

Ubuntu Linux was successfully installed and configured as a **guest operating system** on Windows 10 using Oracle VirtualBox with custom CPU, memory, storage, and ISO settings. The virtual machine was successfully started and verified, demonstrating the use of virtualization to run a Linux operating system on a Windows host.
